

Agentic Development by Maitri Services

One Agentic Engineer. Powered by AI. Shipping at Startup Speed.

Stop paying for headcount. Start paying for outcomes.

Maitri's Agentic Development model pairs you with a dedicated Agentic Engineer who commands a fleet of AI coding agents to capture requirements, develop, test, deploy, and manage software at dramatically higher velocity, with streamlined project oversight, faster feedback loops, and no two-week wait.

You define what to build. We make it real. Continuously.

How It Works

Your Agentic Engineer is a seasoned full-stack professional – architecture, infrastructure, development, testing, deployment, and performance – who commands a fleet of specialized AI agents simultaneously to deliver the output of a full engineering team. Every line of AI-generated code passes through automated security scanning, regression testing, and expert human review. A dedicated Engagement Manager keeps the process on track so your Agentic Engineer stays focused on building.

What You Get

- **Direct collaboration with your Agentic Engineer** – minimal layers between you and the person building your product
- **A dedicated Engagement Manager** ensuring accountability, communication, and delivery coordination
- **3-5x the throughput** of a comparably-priced traditional offshore team
- **Continuous delivery** capable of same-day feature deployment
- **Production-grade code** governed by automated security scanning and human architecture review
- **Full ownership** of all code, documentation, and infrastructure – no proprietary lock-in

Best Fit

Agentic Development is designed for organizations that can move fast on requirements:

- Startup founders with a clear product vision building MVPs or v1 products
- Product-led companies with defined roadmaps and decisive leadership
- Innovation labs and R&D teams within larger enterprises
- Companies maintaining existing products where the work is primarily break/fix
- CTOs and VP Engineering leaders who want the output of a full team with the overhead of one senior hire

Why Not Just Use AI Tools Directly?

Tools without governance are dangerous. Copilot suggests code completions. Off-the-shelf AI coding tools generate code without understanding your architecture, security requirements, or production environment. Our Agentic Engineers coordinate multiple specialized AI agents simultaneously – and apply the architectural judgment, security awareness, and production discipline that turns AI output into software you can trust. It's the difference between a calculator and a trading floor.

Flexible by Design

Start with a build engagement. Ship your product. Transition to ongoing support. Scale back up when the next big initiative hits. Your Agentic Engineer retains full context across every phase, so you never lose momentum re-onboarding a new team. Need compliance-grade QA alongside agentic development? Need to blend with a traditional dedicated team for a complex workstream? We flex to fit – you're never locked into a single model.

Common Questions

"What does working with an Agentic Engineer actually look like day-to-day?"

You communicate directly with your Agentic Engineer and Engagement Manager via Slack, Teams, email, or calls. You set priorities, your Agentic Engineer builds. No stand-ups, sprint rituals, or status chasing required. Your engagement manager keeps work moving, surfaces decisions, and ensures alignment – giving you the feel of a senior technical co-founder on call, without the equity conversation.

"We have compliance requirements."

Our model supports regulated industries with automated audit trails, documented decision logs, and compliance-aware workflows. And if traditional team-based delivery is the better fit for your situation, we'll tell you that.

"What if AI-generated code has issues?"

Every line passes through automated security scanning, regression testing, and expert human review – the same quality gates as human-written code, plus additional automated governance layers.

"How do we maintain visibility into progress?"

Your engagement manager maintains a transparent, continuous workflow with your team – including a shared delivery board tracking what's been completed, what's in progress, and what's next, regular check-ins on your preferred cadence, and real-time access to your code repository with full commit history. Every deployment is documented and every decision is logged.

"What happens when the build is done?"

Transition to our ongoing support model. Your original Agentic Engineer stays connected to your codebase for bug fixes, minor enhancements, and continued maintenance. When you're ready for the next major initiative, scale right back up with zero ramp-up time.

"What happens if we stop working together?"

You own everything. All code lives in your repos, documentation in your systems, infrastructure in your cloud. We provide structured knowledge transfer with no proprietary lock-in.

You define what to build. We make it real. Continuously.
